

# Introduction to Robotics

Class 10 : Robot Navigation (Mapping, Exploration)

Riad Ahmed

Lecturer

Brac University

# Robots Navigation

- **Path Planning**: How to I get to my Goal?
- **Localization**: Where am I?
- **Mapping**: Where have I been?
- **Exploration**: Where haven't I been?

# Robots Navigation

- **Path Planning**: How to I get to my Goal?
- **Localization**: Where am I?
- **Mapping**: Where have I been?
- **Exploration**: Where haven't I been?

# Mapping and Exploration

- **Question:**
  - You are roaming around in an unknown space, what can you learn about it?
- Two parts of the problem:
  - **Mapping:** As you roam around the world, how do you build a memory of the shape of the space you have moved through?
  - **Exploration:** Given that you don't know the shape or size of the environment, how to make sure you covered all of it?
- Mapping and Exploration are also “collections of algorithms”
  - We will focus on “Occupancy Grid” algorithms

# What is an Occupancy Grid?

- A way of representing a map as a gridded world where each cell is either “occupied” or “empty” or “unknown”.

Your World

Grid generated by a Robot => boundary shape

# Examples

# What is a Sensor Model?

- **Constructing a Sensor Model**

- A sensor measures *raw values* in an environment
- You have to map that into a Grid Cell Value.
- Robots can have very different sensors and configurations
- Examples:
  - LIDAR/Depth Camera
  - Vs. a 360 degree vision/ranging system

# Constructing a Sensor Model

- **Example: Depth Sensor Model**

$R$  = maximum range,  $B$  = maximum angle

Let say the sensor at point  $p$  returns **distance** = " $r$ "

Region 1 ( $\text{dist} < r$ , grid cell probably empty)

Region 2 ( $\text{dist} = r$ , grid cell probably obstacle)

Region 3 ( $\text{dist} > r$ , grid cell unknown/obscured)

- **Simplest Sensor Model**

Where I stand is Empty (white)

- **A Better Model**

Set Region 1 cells as Empty (white)

Set Region 2 cells as Occupied (black).

*Pick a max range/angle where data is reliable*

Rest is still Unknown (gray)

# A Simple OG Mapping Algorithm

## 1. Initialize a Grid

- Set all locations as “unknown”, pick a start location and orientation

## 2. Update the Grid

- *Mark your current grid position as “empty”*
- Using your better sensor model,
- *Mark all visible grid locations as “empty” or “occupied”*

## 3. Pick a Next Move

- Look at neighboring grid positions in your map
- Pick a neighboring grid location that is empty (randomly)
- Move to it and update your current position in the Grid

## 4. Loop forever

- Keep moving and updating the grid (unless you are “done”)

# Exploration

- Basic Concept in Robotics: Navigating a GRID Graph is different
  - DFS works, but will still make a robot retrace steps
  - **Better choice: Frontier Based Exploration**

# Exploration in Grid Worlds

- **Frontier Based Exploration**

- A common technique for building maps

- **Key Idea:**

- Identify the “frontiers” between known and unknown

*Frontier cell = a unknown cell with at least one empty cell*

- Pick a frontier cell (e.g. the closest)

*Plan a path to go explore it.*

- **Done Condition:**

*No more frontier nodes left => your map is Complete!*

*If finite world, then any algorithm that systematically explores frontier nodes is guaranteed to cover the whole world.*

A **Frontier Node** is a  
Gray node (Unknown)  
next to a  
White node (Empty)

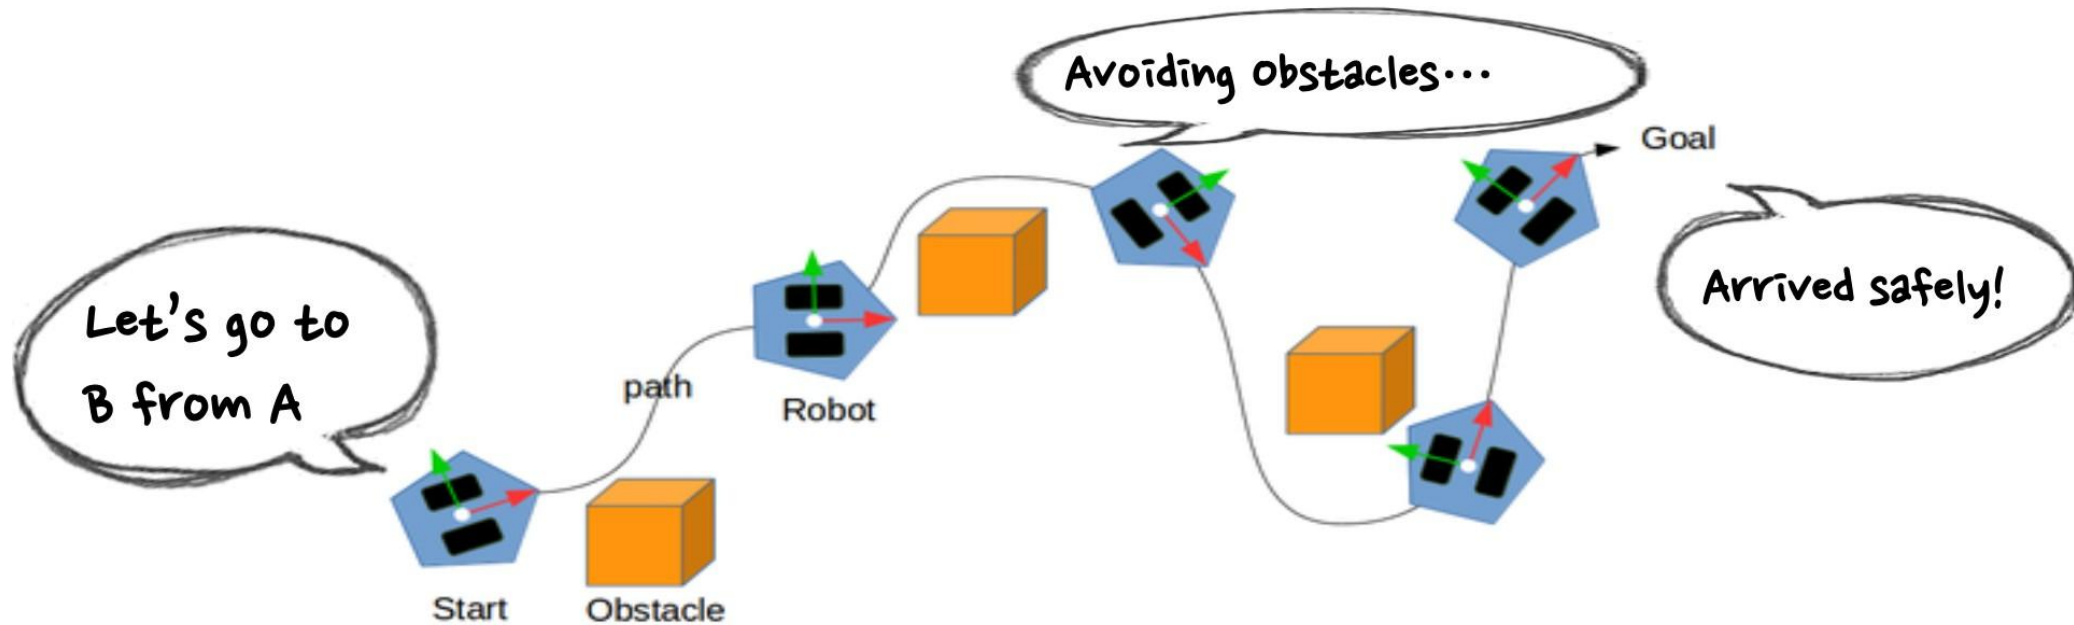

A **Frontier Node** is a  
Gray node (Unknown)  
next to a  
White node (Empty)

# Summary

- ① **Position:** Measuring/estimating the robot's position
- ② **Sensing:** Measuring obstacles such as walls and objects
- ③ **Map:** Maps with road and obstacle information
- ④ **Path:** Calculate optimal path to the destination and follow the path

# Summary

① **Position**

② **Sensing**

③ **Map**

④ **Path**

Position+Sensing → **Map**

**SLAM**

**Simultaneous Localization And Mapping**

Position+Sensing+Map → **Path**

**Navigation**

# Next Class

Control Theory

# The End

# Thank You
